10088] Table IC summarizes additional polynucleotides encompassed by the invention (including cDNA clones related to the sequences (Clone ID), contig sequences (contig identifier (Contig ID); contig mucleotide sequence identifiers (SEQ ID NO:X)), and genomic sequences (SEQ ID NO:B). The first column provides a unique clone identifier, "Clone ID", for a cDNA clone related to each contig sequence. The second column provides the sequence identifier, "SEQ ID NO:X", for each contig sequence. The third column provides a unique contig identifier, "Contig ID:" for each contig sequence. The fourth column, provides a BAC identifier "BAC ID NO:A" for the BAC clone referenced in the corresponding row of the table. The fifth column provides the nucleotide sequence identifier, "SEQ ID NO:B" for a fragment of the BAC clone identified in column four of the corresponding row of the table. The sixth column, "Exon Fronto", provides the location (i.e., nucleotide position numbers) within the polynucleotide sequence of SEQ ID NO:B which delineate certain polynucleotides of the invention (e.g., polypeptides containing amino acid sequences encoded by the polynucleotide sequences delineated in column six, and fragments and variants thereo).

Table 1C

| cDNA Clone | SEQ ID NO:X | CONTIG ID: | BAC ID: A | SEQ ID NO:B | EXON        |

[0089] Table 1D: The polynucleotides or polypeptides, or agonists or antagonists of the present invention can be used in assays to test for one or more biological activities. If these polynucleotides and polypeptides do exhibit activity in a particular assay, it is likely that these molecules may be involved in the diseases associated with the biological activity. Thus, the polynucleotides or polypeptides, or agonists or antagonists ould be used to treat the associated disease.

[0090] The present invention encompasses methods of detecting, preventing, diagnosing, prognosticating, treating, and/or ameliorating a disease or disorder. In preferred embodiments, the present invention encompasses a method of treating diabetes mellitus comprising administering to a patient in which such detection, treatment, prevention, and/or amelioration is desired a protein, nucleic acid, or antibody of the invention (or fragment or variant thereof) in an amount effective to detect, prevent, diagnose, prognosticate, treat, and/or ameliorate diabetes mellitus.

[0091] In another embodiment, the present invention also encompasses methods of detecting, preventing, diagnosing, prognosticating, treating, and/or ameliorating diabetes mellitus; comprising administering to a patient <u>combinations</u> of the proteins, nucleic acids, or antibodies of the invention (or fragments or variants thereof), sharing similar indications as shown in the corresponding rows in Column 3 of Table ID.

[1092] Table ID provides information related to biological activities for polynucleotides and polypeptides of the invention (including antibodies, agonists, and/or antagonists thereof). Table ID also provides information related to assays which may be used to test polynucleotides and polypeptides of the invention (including antibodies, agonists, and/or antagonists thereof) for the corresponding biological activities. The first column ("Gene No.") provides the gene number in the application for each clone identifier. The second column ("CDNA Clone ID.") provides the unique clone identifier for each clone as previously described and indicated in Table IA through Table ID. The third column ("AA SEQ ID NO.Y.") indicates the Sequence Listing SEQ ID Number for polypeptide sequences encoded by the corresponding

cDNA clones (also as indicated in Tables 1A, Table 1B, and Table 2). The fourth column ("Biological Activity") indicates a biological activity corresponding to the indicated polypeptides (or polynucleotides encoding said polypeptides). The fifth column ("Exemplary Activity Assay") further describes the corresponding biological activity and also provides information pertaining to the various types of assays which may be performed to test, demonstrate, or quantify the corresponding biological activity.

[0093] Table 1D describes the use of, inter alia, FMAT technology for testing or demonstrating various biological activities. Fluorometric microvolume assay technology (FMAT) is a fluorescence-based system which provides a means to perform nonradioactive cell- and bead-based assays to detect activation of cell signal transduction pathways. This technology was designed specifically for ligand binding and immunological assays. Using this technology, fluorescent cells or beads at the bottom of the well are detected as localized areas of concentrated fluorescence using a data processing system. Unbound flurophore comprising the background signal is ignored, allowing for a wide variety of homogeneous assays. FMAT technology may be used for peptide ligand binding assays, immunofluorescence, apoptosis, cytotoxicity, and bead-based immunocapture assays. See, Miraglia S et. al., "Homogeneous cell and bead based assays for highthroughput screening using flourometric microvolume assay technology." Journal of Biomolecular Screening; 4:193-204 (1999). In particular, FMAT technology may be used to test, confirm, and/or identify the ability of polypeptides (including polypeptide fragments and variants) to activate signal transduction pathways. For example, FMAT technology may be used to test, confirm, and/or identify the ability of polypeptides to upregulate production of immunomodulatory proteins (such as, for example, interleukins, GM-CSF, Rantes, and Tumor Necrosis factors, as well as other cellular regulators (e.g. insulin)). [00941 Table 1D also describes the use of kinase assays for testing, demonstrating, or quantifying biological activity. In this regard, the phosphorylation and de-phosphorylation of specific amino acid residues (e.g. Tyrosine, Serine, Threonine) on cell-signal transduction proteins provides a fast, reversible means for activation and de-activation of cellular signal transduction pathways. Moreover, cell signal transduction via phosphorylation/de-phosphorylation is crucial to the regulation of a wide variety of cellular processes (e.g. proliferation, differentiation, migration, apoptosis, etc.). Accordingly, kinase assays provide a powerful tool useful for testing, confirming, and/or identifying polypeptides (including polypeptide fragments and variants) that mediate cell signal transduction events via protein phosphorylation. See e.g., Forrer, P., Tamaskovic R., and Jaussi, R. "Enzyme-Linked Immunosorbent Assay for Measurement of JNK. ERK, and p38 Kinase Activities" Biol. Chem. 379(8-9): 1101-1110 (1998).

| Gene No. | cDNA Clone ID | AA SEQ ID | Biological Activity    | Exemplary Activity Assay                | Preferred Indication                   |

| - |  | preferred indications include           |
|---|--|-----------------------------------------|
|   |  | conditional on definition and ton       |
|   |  | cardiovascular, endomenal and/or        |
|   |  | angiogenic disorders (e.g., systemic    |
|   |  | disorders that affect vessels such as   |
|   |  | diabetes mellitus, as well as diseases  |
|   |  | of the vessels themselves, such as of   |
|   |  | the arteries, capillaries, veins and/or |
|   |  | lymphatics). Highly preferred are       |
|   |  | indications that stimulate              |
|   |  | angiogenesis and/or                     |
|   |  | cardiovascularization. Highly           |
|   |  | preferred are indications that inhibit  |
|   |  | angiogenesis and/or                     |
|   |  | cardiovascularization. Highly           |
|   |  | preferred indications include           |
|   |  | antiangiogenic activity to treat solid  |
|   |  | tumors, leukemias, and Kaposi"s         |
|   |  | sarcoma, and retinal disorders.         |
|   |  | Highly preferred indications include    |
|   |  | neoplasms and cancer, such as,          |
|   |  | Kaposi"s sarcoma, hemangioma            |
|   |  | (capillary and cavernous), glomus       |
|   |  | tumors, telangiectasia, bacillary       |
|   |  | angiomatosis,                           |
|   |  | hemangioendothelioma,                   |
|   |  | angiosarcoma,                           |
|   |  | haemangiopericytoma,                    |
|   |  | lymphangioma, lymphangiosarcoma.        |
|   |  | Highly preferred indications also       |
|   |  | include cancers such as, prostate,      |
|   |  | breast, lung, colon, pancreatic,        |
|   |  | esophageal, stomach, brain, liver,      |
|   |  | and urinary cancer. Preferred           |
|   |  | indications include benign              |
|   |  | dysproliferative disorders and pre-     |
|   |  | neoplastic conditions, such as, for     |
|   |  | example, hyperplasia, metaplasia,       |

| indications include blood disorders  (e.g. as described bloow under  "Immune Adrity", "Blood-Related  "Booders", and "Cardiovascular  Disorders", and "Cardiovascular  Disorders", "Brettered indications  Inductor and adritis, systemic lupus  and an adritis, systemic lupus  and or as described below) and  farmandeficiencis (e.g., as  described below). Additional  preferred indications include  inflammation and inflammator  disorders (e.g., as and end chronic  inflammation and inflammator  disorders (e.g., as and end chronic  inflammatory basess, e.g.,  inflammatory bowel disease and  chronic stages and  disorders (e.g., as and end printing  disorders) (e.g., as and end end end  disorders) (e.g., as and end end  disorders) (e.g., as and end end  disorders) (e.g., as and  disorders) (e.g., as an | A highly preferred emboliment<br>of the invention includes a method of<br>the invention includes a method of<br>strainmaint of cell proliferation.<br>An alternative highly preferred<br>and alternative highly preferred and alternative of the<br>methods a method for inhibiting T and alternative of the<br>includes a method for inhibiting T preferred emboliment of the<br>invention includes a method for a<br>mention includes a method for a<br>method includes a method for a<br>method includes a method for<br>inhibiting the activation of and/or<br>inhibiting the activation of the<br>strainhaling (e.g., increasing) III.2<br>strainhaling (e.g., increasing) III.2<br>preferred embodiment of the |

| under "Infectious Disease"). | Preterred indications include<br>neonlastic diseases (e.g., as described | below under "Hyperproliferative    | Disorders"), blood disorders (e.g., as | described below under "Immune     | Activity", "Cardiovascular    | Disorders", and/or "Blood-Related     | Disorders"), and infection (e.g., an | infectious disease as described below | under "Infectious Disease"). Highly | preferred indications include | autoimmune diseases (e.g.,           | rheumatoid arthritis, systemic lupus | erythematosis, multiple sclerosis | and/or as described below) and | immunodeficiencies (e.g., as          | described below). Additional highly   | preferred indications include      | inflammation and inflammatory   | disorders. Highly preferred | indications also include neoplastic  | discases (e.g., leukemia, lymphoma, | and/or as described below under      | "Hyperproliferative Disorders"). | Highly preferred indications include | neoplasms and cancers, such as,    | leukemia, lymphoma, prostate,       | breast, lung, colon, pancreatic,      | esophageal, stomach, brain, liver,   | and urinary cancer. Other preferred | indications include benign     | dysproliferative disorders and pre-  | neoplastic conditions, such as, for         | example, hyperplasia, metaplasia, | and/or dysplasia. Preferred           | indications include arthritis, asthma, |

|                              | Assays for the activation of<br>transcription through the AP1            | response element are well-known in | the art and may be used or routinely   | modified to assess the ability of | polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) to     | modulate growth and other cell        | functions. Exemplary assays for     | transcription through the AP1 | response element that may be used or | routinely modified to test AP1-      | response element activity of      | polypeptides of the invention  | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in Berger et al., | Gene 66:1-10 (1988); Cullen and | Malm, Methods in Enzymol    | 216:362-368 (1992); Henthorn et al., | Proc Natl Acad Sci USA 85:6342-     | 6346 (1988); Rellahan et al., J Biol | Chem 272(49):30806-30811 (1997); | Chang et al., Mol Cell Biol          | 18(9):4986-4993 (1998); and Fraser | et al., Eur J Immunol 29(3):838-844 | (1999), the contents of each of which | are herein incorporated by reference | in its entirety. Human T cells that | may be used according to these | assays are publicly available (e.g., | through the ATCC <sup>TM</sup> ). Exemplary | human T cells that may be used    | according to these assays include the | SUPT cell line, which is an IL-2 and   |
|                              | Activation of<br>transcription through                                   | AP1 response element               | in immune cells (such                  | as T-cells).                      |                               |                                       |                                      |                                       |                                     |                               |                                      |                                      |                                   |                                |                                       |                                       |                                    |                                 |                             |                                      |                                     |                                      |                                  |                                      |                                    |                                     |                                       |                                      |                                     |                                |                                      |                                             |                                   |                                       |                                        |
